8 | **MSC SimManager Enterprise Edition R3.1 Installation and Administration Guide** Introduction to SimManager Enterprise Edition

Introduction to SimManager Enterprise Edition

SimManager facilitates simulation processes by integrating external batch-based server applications, enterprise databases, enterprise services and client applications. For optimal operation, it requires specific hardware, storage, and networking infrastructures. For successful SimManager deployment, an appropriate level of planning, design, and implementation (installation, configuration, and optional customization) is required.

This chapter includes a system-wide overview for the systems administrator responsible for SimManager installation. Sections discuss the general requirements of the basic SimManager system including system components, SimManager topology, and roles and responsibilities of those involved in the project. Specific capabilities for a particular implementation are achieved by configuring and customizing the system. This process is described in detail in the *MSC SimManager Enterprise Edition R3.1 Configuration and Deployment Guide*.

Note: You will also find installation instructions for basic deployment of the EnterpriseEdition Portal. This portal is intended to work in conjunction with other MSC.Software products such as SimXpert and SimDesigner. The sophistication of the SimManager environment can vary considerably, which may result in the need for additional hardware and software components.
